

# Guess My Number

Write a program to play "guess my number". The program should generate a random number between 0 and 100 and then prompt the user to guess the number. If the user guesses incorrectly the program gives the user a hint using the words 'higher' or 'lower' (as shown in the sample output). It prints a message 'Yes - it is' if the guessed number is same as the random number generated.

Sample Input:

```
Guess a number between 0 and 100 and enter it here: 59
```

Output:

```
You guessed it wrong :( You should have gone higher.
```

Sample Input:

```
Guess a number between 0 and 100 and enter it here: 43
```

Output:

```
Yes - that is correct :)
```
